[CASA] "Xvfb" error messages

Juergen Ott - 2023-11-01 - CASA

On some computers CASA starts with an "Xvfb" error message. The "X virtual frame buffer" is only used by the viewer to transfer non-GUI outputs to the terminal. For most applications this is not really needed. But for a permanent fix, one may install xvfb on the system. E.g. via

```
sudo apt-get install xvfb
```

followed by a restart of CASA.

If you still receive the errors after installing xvfb, it usually is not a something to worry about as long as you can see the logger, viewer, etc and if you can communicate with those windows.
